No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               seq length: 0 seq length: 2000000000

Peptide immuno:therapeutic agent to treat allergic diseases - contains multi-epitope peptide containing T cell epitope regions from different allergens	WPI; 1997-470495/43.	Dairiki K, Iwama A, Kino K, Kume A, Sone T;	(MEIP) MEIJI MILK PROD CO LTD.	10-MAR-1996; 96JP-0080702.	10-MAR-1997; 97WO-JP00740.	12-SEP-1997.	W09732600-A1. AFT 871 DOC	Synthetic.	Multi-epitope peptide; immunotherapeutic agent; allergic disease; T-cell epitope region; allergen; lymphocyte; immunoglobulin E.	Multi-epitope peptide used as immunotherapeutic agent #1.	24-MAR-1998 (first entry)	AAW27369;	RESULT 1 AAW27369 AAW27369 standard, peptide; 80 AA.

It comprises T cell epitope regions from 2 or more different allergens (preferably linked via arginine or lysine dimers), where the T cell epitope regions: have a positivity index greater than 100 as measured in a patient group responding to the allergen; have at least 70% reactivity with lymphocytes from patients responding to the allergen; and are not reactive with immunoglobulin E (1gE) antibodies from patients responsive to the allergen. The agent can be used to prevent and treat a wide variety of allergic diseases, e.g. by desensitisation. Side effects, e.g. those mediated by 1gE, are reduced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
The present sequence represents a multi-epitope peptide which is used as a new immunotherapeutic agent. It comprises T cell epitope regions from 2 or more different allergens (preferably linked via arginine or lysine dimers), where the T cell epitope regions: have a positivity index greater than 100 as measured in a patient group responding to the allergen; have at least 70% reactivity with lymphocytes from patients responding to the allergen; and are not reactive with immunoglobulin E (IgE) antibodies from patients responsive to the allergen. The agent can be used to prevent and treat a wide variety of allergic diseases, e.g. by desensitisation. Side effects, e.g. those mediated by IgE, are reduced.
                                                                                                                                                                                                                                          contains multi-epitope peptide co
from different allergens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Multi-epitope peptide used as immunotherapeutic agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    24-MAR-1998

                                                                                                                                                        The present sequence represents a multi-epitope peptide which is used a new immunotherapeutic agent. It comprises T cell epitope regions froor more different allergens (preferably linked via arginine or lysine dimers), where the T cell epitope regions: have a positivity index greater than 100 as measured in a patient group responding to the allergen; have at least 70% reactivity with lymphocytes from patients responding to the allergen; and are not reactive with immunoglobulin E (1gE) antibodies from patients responsive to the allergen. The agent c be used to prevent and treat a wide variety of allergic diseases, e.g. be used to prevent and treat a wide variety of allergic diseases, e.g. desensitisation. Side effects, e.g. those mediated by 1gE, are reduced

                                                                                                                                                                                                                         The present invention describes a peptide, its complex, derivative or its polymerizate, where the peptide (I) has a formula of: alpha1-alpha2-alpha3-alpha4-alpha5-alpha6-alpha7 where alpha1 to alpha7 = amino acid sequence selected from amino acid sequences ranging from 11-19 amino acids derived from T cell epitopes derived from cedar (japanese cedar - Cryptomeria japonica) pollen allergens. The peptide can be used in an antisugipolinosis agent. AAF59011 to AAF59062 and AAB69094 to AAB69121 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                            Novel peptide and its use

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a peptide, its complex, derivative or its polymerizate, where the peptide (I) has a formula of: alpha1-alpha2-alpha3-alpha4-alpha5-alpha5-alpha6-alpha7 where alpha1 to alpha7 a manino acid sequence selected from amino acid sequences ranging from 11-19 amino acids derived from T cell epitopes derived from cedar (japanese cedar - Cryptomeria japonica) pollen allergens. The peptide can be used in an antisugipollinosis agent. AAP59011 to AAF59062 and AAB69094 to AAB69121 represent sequences used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 1998-577037/49
           The present invention describes a method for chemically synthesising a peptide by solid phase synthesis. The method comprises processing a carrier resin to which the C-terminal amino acid derivative of the target peptide has been preliminarily bonded is characterised by adding a protective group to inactivate a part of alpha-amino groups of an amino acid capable of undergoing a peptide extension reaction on the carrier resin. The method is useful for synthesising a peptide by solid phase synthesis. The present son be readily synthesised in with a high success ratio without using the segment condensation method or gene manipulations. The present sequence represents an amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                17-JAN-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAB23905 standard; peptide; 74
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptide synthesis; chemical synthesis; solid phase synthesis.

                                                                                                                                                       The present invention describes a method for chemically synthesising a peptide by solid phase synthesis. The method comprises processing a carrier resin to which the C-terminal amino acid derivative of the target peptide has been preliminarily bonded is characterised by adding a protective group to inactivate a part of alpha-amino groups of an amino acid capable of undergoing a peptide extension reaction on the carrier resin. The method is useful for synthesising a peptide by solid phase synthesis. Long chain peptides can be readily synthesised in with a high success ratio without using the segment condensation method or gene manipulations. The present sequence represents an amino acid peptide sequence given in an example from the present invention.

                                                                                                                                                                                                                                                             The present invention describes a method for chemically synthesising a peptide by solid phase synthesis. The method comprises processing a carrier resin to which the C-terminal amino acid derivative of the target peptide has been preliminarily bonded is characterised by adding a protective group to inactivate a part of alpha-amino groups of an amino acid capable of undergoing a peptide extension reaction on the carrier resin. The method is useful for synthesising a peptide by solid phase synthesis. Long chain peptides can be readily synthesised in with a high success ratio without using the segment condensation method or gene manipulations. The present sequence represents an amino acid peptide sequence given in an example from the present invention.

The method comprises processing a carrier resin to which the C-terminal amino acid derivative of the target peptide has been preliminarily bonded is characterised by adding a protective group to inactivate a part of alpha-amino groups of an amino acid capable of undergoing a peptide extension reaction on the carrier resin. The method is useful for synthesising a peptide by solid phase synthesis. Long chain peptides can be readily synthesised in with a high success ratio without using the segment condensation method or gene manipulations. The present sequence represents an amino acid peptide sequence given in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chemically synthesizing a peptide by solid phase synthesis by adding protective group to inactivate part of alpha amino group of an amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2000-602106/57

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     its polymerizate, where the peptide (I) has a formula of: alpha1-alpha2-alpha3-alpha4-alpha5-alpha6-alpha7 alpha1-alpha5-alpha6-alpha7 anino acid sequence selected from amino acid sequences ranging from 11-19 amino acids derived from T cell epitopes derived from cedar (japanese cedar - Cryptomeeria japonica) pollen alergens. The peptide can be used in an antisugipollinossis agent. AAF59011 to AAF59062 and AAB69094 to AAB69121 represent sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            alpha1-alpha2-alpha3-alpha4-alpha5-alpha6-alpha7
where alpha1 to alpha7 = amino acid sequence selected from amino acid
sequences ranging from 11 g amino acids derived from T cell epitopes
derived from cedar (japanese cedar - Cryptomeria japanica) pollen
allergens. The peptide can be used in an antisugipollinosis agent.

                                                                                                                                                                              The present invention describes a peptide, its complex, derivative or its polymerizate, where the peptide (I) has a formula of: alpha1-alpha2-alpha3-alpha4-alpha5-alpha6-alpha7 where alpha1 to alpha7 = amino acid sequences ranging from 11-19 amino acids derived from T cell epitopes derived from cedar (japanese cedar - Cryptomeria japonica) pollen allergens. The peptide can be used in an antisugipollinosis agent. AAF59011 to AAF59062 and AAB69094 to AAB69121 represent sequences used
                                                                                                                                                       Sequence
                                                                                                                                                                        in the exemplification of the present invention.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
